To Whom it Concerns:

PressurePro has been tested with a variety of products, sealants and balancing products, including Equal. Our testing shows that the products seldom climb the sideway to the valve stem area. We did not have any instances in our testing where these products proved to be problematic when working with Pressure sensors.

PressurePro does recommend the use of a filtered dill valve for the core of the valve stem. This filtered valve tends to be a further step of protection for the sensor, is low cost and will most likely add to the life of the sensor.

PressurePro has further recommended to the manufacturers of these products, sealants and balancing powders, to perform testing independent of PressurePro's testing to ensure reliability of performance for their customers.

PressurePro is produced to the highest standards. Each sensor uses a special sealant developed by 3M to protect the sensor from damage by outside liquids and materials. PressurePro performed well in testing of the products and continues to perform well in real time, including tires with sealant and balancing products in them.
